Bring Focus to Your Quality Reporting Efforts

With the greater focus on quality and value, providers must report on quality improvements for shared savings programs, MACRA, and MIPS. Without data insights, reporting and contract negotiation are often based on guesswork. MedeAnalytics Quality Management enables you to analyze readmissions, gaps in care, patient safety indicators, patient mortality, hospital-acquired conditions, and potentially preventable procedures—so you can easily determine your compliance with quality measures and get back to patient care.

VIEW YOUR ER QUALITY METRICS AT A GLANCE

With MedeAnalytics Quality Management, You Can:

- Analyze clinical quality and outcomes components like 30-day unplanned readmissions
- Identify hospital-acquired conditions
- Review mortality rates based on industry-standard methodologies
- View gaps in care with HEDIS®-like measures
- Reduce the resource-intensive, error-prone process of chart abstraction
- Identify chronic conditions and potentially missed diagnoses that affect patient risk-adjustment factor (RAF) scores
